#### Abstract

In this work, we consider a collocation method for solving the pantograph-type Volterra Hammerstein integral equations based on the first kind Chebyshev polynomials. We use the Lagrange interpolating polynomial to approximate the solution. The convergence of the presented method has been analyzed by over estimating for error. Finally, some illustrative examples are given to test the accuracy of the method. The presented method is compared with the Legendre Tau method.

Keywords: Numerical solution, Collocation method, Pantograph-type, Volterra Hammerstein integral equations, Convergence analysis.

## 1 | Introduction

This paper aims to obtain the exact approximations by collocation method based on the first kind Chebyshev polynomials for solutions of the following pantograph Volterra Hammerstein integral equations.

$$
\begin{equation*}
\mathrm{z}(\mathrm{~s})=\mathrm{g}(\mathrm{~s})+\int_{0}^{\mathrm{qs}} \mathrm{R}(\mathrm{t}, \mathrm{~s}) \mathrm{G}(\mathrm{t}, \mathrm{z}(\mathrm{t})) \mathrm{dt}, \quad 0<\mathrm{q}<1, \quad \mathrm{~s} \in[0,1] \tag{1}
\end{equation*}
$$

Where $g(s), R(s, t)$ and $G(t, z(t))$ are smooth functions on their domains. We assume that the function $G(t, z(t))$ satisfies in the Lipschitz condition with respect to the second variable.

These equations appear in many branches of science such as control theory, biology, ecology and etc [1]-[7]. Severral methods have been proposed to solve the integral equations in [8]-[11], [5], [12]-[16], [6], [17]-[26]. Ansari and Mokhtary [27] presented the Legendre Tau method for solving Eq. (1) and
discussed applying the spectral methods to obtain a reliable numerical solution for Eq. (1) according to the well-known existence and uniqueness theorems in [27].

Here, we approximate the solution of Eq. (1) using the Lagrange interpolating polynomial. We consider a collocation method based on the first kind Chebyshev polynomials for solving Eq. (1) and get a nonlinear system that can be solved by Newton method to obtain the solutions at the grid pionts. In order convergence of the presented method. Some numerical examples prepared to test the efficiency and accuracy of the proposed method. We compare the numerical results of the presented method with the Legendre Tau method in [27].

## 2 | Algorithm of the Method

The first kind of Chebyshev polynomials $T_{N}(s)$ are orthogonal at $[-1,1]$ with respect to the weight function $w(s)=\left(1-s^{2}\right)^{-1 / 2}$ and are defined by [28]:

$$
\mathrm{T}_{\mathrm{N}}(\mathrm{~s})=\cos \left(\mathrm{N} \cos ^{-1}(\mathrm{~s})\right) .
$$

All Chebyshev polynomials $T_{N}(s)$ can be generated by the following recursion relation

$$
\mathrm{T}_{\mathrm{N}}(\mathrm{~s})=2 \mathrm{sT}_{\mathrm{N}-1}(\mathrm{~s})-\mathrm{T}_{\mathrm{N}-2}(\mathrm{~s}), \quad \mathrm{N}=2,3, \ldots
$$

With

$$
\mathrm{T}_{0}(\mathrm{~s})=1, \mathrm{~T}_{1}(\mathrm{~s})=\mathrm{s} .
$$

The Gauss quadrature formula

$$
\int_{-1}^{1} \mathrm{f}(\mathrm{~s}) \mathrm{w}(\mathrm{~s}) \mathrm{ds} \approx \sum_{\mathrm{k}=0}^{\mathrm{N}} \mathrm{f}\left(\mathrm{~s}_{\mathrm{k}}\right) \mathrm{w}_{\mathrm{k}}
$$

is exact for any polynomial of degree $\leq 2 N+1$.

Now, in order to use the theory of orthogonal Chebyshev polynomials, applying the following change of variable

$$
\left\{\begin{array}{lr}
\mathrm{t}=\frac{\mathrm{q}}{2} \eta+\frac{\mathrm{q}}{2}, & -1 \leq \eta \leq \zeta, \\
\mathrm{s}=\frac{1}{2} \zeta+\frac{1}{2}, & -1 \leq \zeta<1
\end{array}\right.
$$

For Eq. (1), we have

$$
\begin{equation*}
\widetilde{z}(\zeta)=\widetilde{g}(\zeta)+\int_{-1}^{\zeta} \widetilde{R}(\zeta, \eta) \widetilde{G}(\eta, \widetilde{z}(\eta)) d \eta, \quad-1 \leq \zeta \leq 1 . \tag{2}
\end{equation*}
$$

Where

$$
\left\{\begin{array}{l}
\widetilde{z}(\zeta)=z\left(\frac{1}{2} \zeta+\frac{1}{2}\right), \\
\widetilde{g}(\zeta)=g\left(\frac{1}{2} \zeta+\frac{1}{2}\right), \\
\widetilde{R}(\zeta, \eta)=\frac{q}{2} R\left(\frac{1}{2} \zeta+\frac{1}{2}, \frac{q}{2} \eta+\frac{q}{2}\right), \\
\widetilde{G}(\eta, \widetilde{z}(\eta))=G\left(\frac{q}{2} \eta+\frac{q}{2}, z\left(\frac{q}{2} \eta+\frac{q}{2}\right)\right)
\end{array}\right.
$$

Using the Lagrange interpolating polynomial, we can approximate $\tilde{z}(\zeta)$ as

$$
\begin{equation*}
\mathrm{I}_{\mathrm{N}}^{\mathrm{C}}(\widetilde{\mathrm{z}}(\zeta))=\sum_{\mathrm{j}=0}^{\mathrm{N}} \mathrm{l}_{\mathrm{j}}(\zeta) \tilde{\mathrm{z}}\left(\mathrm{~s}_{\mathrm{j}}\right) . \tag{3}
\end{equation*}
$$

CAND Where
63

$$
l_{i}(\eta)=\prod_{j=0, j \neq i}^{N} \frac{\eta-s_{j}}{s_{i}-s_{j}}, \quad i=0(1) N .
$$

And $\left\{s_{j}=-\cos \left(\frac{(2 j+1) \pi}{2 N+2}\right)\right\}_{j=0}^{N}$ are the Chebyshev Gauss quadrature points. Also, from Eq. (3), we can write

$$
\begin{equation*}
\widetilde{\mathrm{G}}\left(\zeta, \mathrm{I}_{\mathrm{N}}^{\mathrm{C}}(\widetilde{\mathrm{z}}(\zeta))\right)=\sum_{\mathrm{j}=0}^{\mathrm{N}} \mathrm{l}_{\mathrm{j}}(\zeta) \widetilde{\mathrm{G}}\left(\mathrm{~s}_{\mathrm{j}}, \widetilde{\mathrm{z}}\left(\mathrm{~s}_{\mathrm{j}}\right)\right) . \tag{4}
\end{equation*}
$$

Now, collocating the nodes $s_{i}, i=0(1) N$, in Eq. (2), we have

$$
\begin{equation*}
\widetilde{\mathrm{z}}\left(\mathrm{~s}_{\mathrm{i}}\right)=\widetilde{\mathrm{g}}\left(\mathrm{~s}_{\mathrm{i}}\right)+\int_{-1}^{\mathrm{s}_{\mathrm{i}}} \widetilde{\mathrm{R}}\left(\mathrm{~s}_{\mathrm{i}}, \eta\right) \widetilde{\mathrm{G}}\left(\eta, \mathrm{I}_{\mathrm{N}}^{\mathrm{C}}(\widetilde{\mathrm{z}}(\eta))\right) \mathrm{d} \eta, \quad \mathrm{i}=0(1) \mathrm{N} \tag{5}
\end{equation*}
$$

Solving the non-linear system (5) by the Newton method, we get the values of $\tilde{z}\left(s_{j}\right)$. Substituting these values into Eq. (3), the values of $I_{N}^{C}(\tilde{z}(\zeta))$ are obtained, for all $\in[-1,1]$.

## 3 | Convergence Analysis

In this section, using some useful inequalities and lemmas from [29], [30], we will try to determine over estimate for $\left\|I_{N}^{C}(\tilde{z}(\zeta))-\tilde{z}(\zeta)\right\|_{L_{w}^{2}(-1,1)}$.

Theorem 1. Assume that $I_{N}^{C}(\tilde{z}(\zeta))$ is the spectral collocation solution of Eq. (2) given by Eq. (3). If the functions $\widetilde{g}(\zeta), \widetilde{R}(\zeta, \eta)$ and $\widetilde{G}(\eta, \tilde{z}(\eta))$ are sufficiently smooth and $\widetilde{G}(\eta, \tilde{z}(\eta))$ satisfies in the Lipschitz condition with respect to the second variable and $e(\zeta)=I_{N}^{C}(\tilde{z}(\zeta))-\widetilde{z}(\zeta)$, then we have

$$
\begin{align*}
\|\mathrm{e}\|_{\mathrm{L}_{\mathrm{w}}^{2}(-1,1)} \leq \mathrm{CN} &  \tag{6}\\
& +\mathrm{CN}^{-1}\left(|\widetilde{\mathrm{~g}}|_{\mathrm{H}_{\mathrm{w}}^{\mathrm{m} ; \mathrm{N}}(-1,1)}+\left.\mathrm{G}\left|\|+\mathrm{N}^{-\mathrm{m}}\right|_{\mathrm{H}_{\mathrm{w}}^{\mathrm{m} ; \mathrm{N}}(-1,1)}\right|_{\mathrm{H}_{\mathrm{w}}^{\mathrm{m} / \mathrm{N}}(-1,1)}\right)
\end{align*}
$$

Proof. The Eq. (5) can be written as follows

$$
\begin{align*}
\widetilde{z}\left(s_{i}\right)=\widetilde{g}\left(s_{i}\right)+ & \int_{-1}^{s_{i}} \widetilde{R}\left(s_{i}, \eta\right) \widetilde{G}\left(\eta, I_{N}^{C}(\widetilde{z}(\eta))\right) d \eta+\int_{-1}^{s_{i}} \widetilde{R}\left(s_{i}, \eta\right) \widetilde{G}(\eta, \widetilde{z}(\eta)) d \eta  \tag{7}\\
& -\int_{-1}^{s_{i}} \widetilde{R}\left(s_{i}, \eta\right) \widetilde{G}(\eta, \widetilde{z}(\eta)) d \eta .
\end{align*}
$$

Multiplying Eq. (7) by $l_{j}(\zeta)$ and sum up from 0 to $N$, we have

$$
\begin{align*}
\mathrm{I}_{\mathrm{N}}^{\mathrm{C}}(\widetilde{\mathrm{z}}(\zeta))= & \mathrm{I}_{\mathrm{N}}^{\mathrm{C}}(\widetilde{\mathrm{~g}}(\zeta)) \\
& +\mathrm{I}_{\mathrm{N}}^{\mathrm{C}}\left(\int_{-1}^{\zeta} \widetilde{\mathrm{R}}(\zeta, \eta)\left(\widetilde{\mathrm{G}}\left(\eta, \mathrm{I}_{\mathrm{N}}^{\mathrm{C}}(\widetilde{\mathrm{z}}(\eta))\right)-\widetilde{\mathrm{G}}(\eta, \widetilde{z}(\eta))\right) \mathrm{d} \eta\right)  \tag{8}\\
& +\mathrm{I}_{\mathrm{N}}^{\mathrm{C}}\left(\int_{-1}^{\zeta} \widetilde{R}(\zeta, \eta) \widetilde{\mathrm{G}}(\eta, \widetilde{\mathrm{z}}(\eta)) \mathrm{d} \eta\right) .
\end{align*}
$$

Subtracting Eq. (8) from the Eq. (2), we have

$$
\begin{equation*}
e(\zeta)=L_{2}+I_{N}^{C}\left(\int_{-1}^{\zeta} \widetilde{R}(\zeta, \eta)\left(\widetilde{G}\left(\eta, I_{N}^{C}(\widetilde{z}(\eta))\right)-\widetilde{G}(\eta, \widetilde{z}(\eta))\right) d \eta\right)+L_{3} \tag{9}
\end{equation*}
$$

Where

$$
\left\{\begin{array}{l}
L_{2}=I_{N}^{C}(\widetilde{g}(\zeta))-\widetilde{g}(\zeta) \\
L_{3}=I_{N}^{C}\left(\int_{-1}^{\zeta} \widetilde{R}(\zeta, \eta) \widetilde{G}(\eta, \widetilde{z}(\eta)) d \eta\right)-\int_{-1}^{\zeta} \widetilde{R}(\zeta, \eta) \widetilde{G}(\eta, \widetilde{z}(\eta)) d \eta
\end{array}\right.
$$

The Eq. (9) can be rewritten as follows

$$
e(\zeta)=L_{2}+\int_{-1}^{\zeta} \widetilde{R}(\zeta, \eta)\left(\widetilde{G}\left(\eta, I_{N}^{C}(\widetilde{z}(\eta))\right)-\widetilde{G}(\eta, \widetilde{z}(\eta))\right) d \eta+L_{3}+L_{4}
$$

Where

$$
\begin{aligned}
& L_{4}=I_{N}^{C}\left(\int_{-1}^{\zeta} \widetilde{R}(\zeta, \eta)\left(\widetilde{G}\left(\eta, I_{N}^{C}(\widetilde{z}(\eta))\right)-\widetilde{G}(\eta, \widetilde{z}(\eta))\right) d \eta\right) \\
&-\int_{-1}^{\zeta} \widetilde{R}(\zeta, \eta)\left(\widetilde{G}\left(\eta, I_{N}^{C}(\widetilde{z}(\eta))\right)-\widetilde{G}(\eta, \widetilde{z}(\eta))\right) d \eta
\end{aligned}
$$

To simplicity, in the following the notation $\|$.$\| has been used instead of \|.\|_{L_{w}(-1,1)}$. Now, from the Eq. (10), we have

$$
\begin{equation*}
\|e(\zeta)\| \leq\left\|L_{2}\right\|+\left\|\int_{-1}^{\zeta} \widetilde{R}(\zeta, \eta)\left(\widetilde{G}\left(\eta, I_{N}^{C}(\widetilde{z}(\eta))\right)-\widetilde{G}(\eta, \widetilde{z}(\eta))\right) d \eta\right\|+\left\|L_{3}\right\|+\left\|L_{4}\right\| \tag{11}
\end{equation*}
$$

Now, in order to determine over estimate for error, we should find the over bound for right hand side of the inequality Eq. (11) term by term.

Using inequality (5.5.22) from [29], we have

$$
\begin{equation*}
\left|\left|\mathrm{L}_{2} \| \leq \mathrm{CN}^{-\mathrm{m}}\right| \widetilde{\mathrm{g}}\right|_{\mathrm{H}_{\mathrm{w}}^{\mathrm{m} ; \mathrm{N}}(-1,1)} \tag{12}
\end{equation*}
$$

Where

$$
\begin{equation*}
|\widetilde{\mathrm{g}}|_{\mathrm{H}_{\mathrm{w}}^{\mathrm{m} ; \mathrm{N}}(-1,1)}=\left(\sum_{\mathrm{k}=\min (\mathrm{m}, \mathrm{~N}+1)}^{\mathrm{m}}\left\|\widetilde{\mathrm{~g}}^{(\mathrm{k})}\right\|^{2}\right)^{1 / 2} \tag{13}
\end{equation*}
$$

For Eq. (12), using Eq. (13) with $m=1$ and Lemma 3.8 from [30], we have

$$
\begin{align*}
& \left\|\mathrm{L}_{3}\right\| \leq \mathrm{CN}^{-1}\left(\left\|\int_{-1}^{\zeta} \frac{\partial(\widetilde{\mathrm{R}}(\zeta, \eta))}{\partial \zeta} \widetilde{\mathrm{G}}(\eta, \widetilde{\mathrm{z}}(\eta)) \mathrm{d} \eta+\widetilde{\mathrm{R}}(\zeta, \zeta) \widetilde{\mathrm{G}}(\zeta, \widetilde{\mathrm{z}}(\zeta))\right\|\right) \\
& \leq \mathrm{CN}^{-1}\left(\left\|\int_{-1}^{\zeta} \frac{\partial(\widetilde{\mathrm{R}}(\zeta, \eta))}{\partial \zeta} \widetilde{\mathrm{G}}(\eta, \widetilde{\mathrm{z}}(\eta)) \mathrm{d} \eta\right\|+\|\widetilde{\mathrm{R}}(\zeta, \zeta)\|\|\widetilde{\mathrm{G}}(\zeta, \widetilde{\mathrm{z}}(\zeta))\|\right)  \tag{14}\\
& \leq \mathrm{CN}^{-1}(\mathrm{C}\|\widetilde{\mathrm{G}}(\eta, \widetilde{\mathrm{z}}(\eta))\|+\|\widetilde{\mathrm{R}}(\zeta, \zeta)\|\|\widetilde{\mathrm{G}}(\zeta, \widetilde{\mathrm{z}}(\zeta))\|) .
\end{align*}
$$

Thus, from Eq. (14), we have

$$
\begin{equation*}
\left\|\mathrm{L}_{3}\right\| \leq \mathrm{CN}^{-1}\|\widetilde{\mathrm{G}}\| \tag{15}
\end{equation*}
$$

To find over bound for $\left\|L_{4}\right\|$, similar to process of obtaining Eq. (15), we have

$$
\begin{equation*}
\left\|\mathrm{L}_{4}\right\| \leq \mathrm{CN}^{-1}\left\|\widetilde{\mathrm{G}}\left(\eta, \mathrm{I}_{\mathrm{N}}^{\mathrm{C}}(\widetilde{\mathrm{z}}(\eta))\right)-\widetilde{\mathrm{G}}(\eta, \widetilde{\mathrm{z}}(\eta))\right\| \tag{16}
\end{equation*}
$$

Since $\tilde{G}(\eta, \tilde{z}(\eta))$ satisfies in the Lipschitz condition with respect to the second variable. Thereby from Eq. (16), we have

$$
\begin{equation*}
\left\|\mathrm{L}_{4}\right\| \leq \mathrm{CN}^{-1} \mathrm{~L}\|\mathrm{e}\| \tag{17}
\end{equation*}
$$

Where $L$ is the Lipschitz constant. Now, applying (5.5.22) from [29] for Eq. (17), we have
$\left\|\mathrm{L}_{4}\right\| \leq \mathrm{CN}^{-1-\mathrm{m}} \mathrm{L}|\widetilde{\mathrm{Z}}|_{\mathrm{H}_{\mathrm{w}}^{\mathrm{m} / \mathrm{N}}(-1,1)}$.

Using Lipschitz condition and (5.5.22) from [29], we have

$$
\left\|\int_{-1}^{\zeta} \widetilde{R}(\zeta, \eta)\left(\widetilde{G}\left(\eta, I_{N}^{C}(\widetilde{z}(\eta))\right)-\widetilde{G}(\eta, \widetilde{z}(\eta))\right) d \eta\right\| \leq \operatorname{CLN}^{-m}|\widetilde{\mathrm{z}}|_{\mathrm{H}_{\mathrm{w}}^{\mathrm{m} ; \mathrm{N}}(-1,1)}
$$

Combining the above estimates with Eq. (11) leads to the intended error estimate Eq. (6).

## 4 | Numerical Results

In this section, we use the proposed method for solving some numerical examples to test the accuracy of the method. We get the numerical results by Wolfram Mathematica 12.2. The presented method has been compared with the Legendre Tau method in [27]. For simplicity, we use the notation $\|$.$\| instead of \|.\|_{L_{w}^{2}}$.

Example 1. Consider the following pantograph-type Volterra Hammerstein integral equation [27]

$$
\mathrm{z}(\mathrm{~s})=\mathrm{g}(\mathrm{~s})+\int_{0}^{\mathrm{qs}} \mathrm{R}(\mathrm{t}, \mathrm{~s}) \mathrm{G}(\mathrm{t}, \mathrm{z}(\mathrm{t})) \mathrm{dt}, \quad \mathrm{~s} \in[0,1] .
$$

Where

$$
\left\{\begin{array}{l}
\mathrm{g}(\mathrm{~s})=-\frac{1}{4} \exp (\mathrm{~s})(\mathrm{s}-\sin (\mathrm{s}))+\tan (\mathrm{s}) \\
\mathrm{q}=\frac{1}{2}, \frac{7}{10} \\
\mathrm{R}(\mathrm{~s}, \mathrm{t})=\exp (\mathrm{s}) \cos ^{2}(\mathrm{t}) \\
\mathrm{G}(\mathrm{t}, \mathrm{z}(\mathrm{t}))=\mathrm{z}^{2}(\mathrm{t})
\end{array}\right.
$$

And the exact solution is $z(s)=\tan (s)$. The function $G(t, z(t))$ satisfies in the Lipschitz condition with respect to the second variable.

Table 1 contains a comparison of the $L^{2}$-norms of the error function between the presented method and the Legendre Tau method in [27] for Example 1 with $q=\frac{1}{2}$. Figs. 1 and 2 show the plots of the obtained errors $\left|z-I_{N}^{C}(z)\right|$ by the presented method in Example 1 for $N=8$ and $N=32$, respectively, with $q=\frac{1}{2}$. Fig. 9 shows tending $\left\|z-I_{N}^{C}(z)\right\|$ to zero by increasing $N$ in Example 1 with $q=\frac{1}{2}$.

Table 2 contains the obtained errors $\left\|z-I_{N}^{C}(z)\right\|$ by the presented method for Example 1 with $q=\frac{7}{10}$. Figs. 3 and 4 show the plots of the obtained errors $\left|z-I_{N}^{C}(z)\right|$ by the presented method in Example 1 for $N=8$ and $N=32$, respectively, with $q=\frac{7}{10}$. Fig. 10 shows tending $\left\|z-I_{N}^{C}(z)\right\|$ to zero by increasing $N$ in Example 1 with $q=\frac{7}{10}$.

Example 2. Consider the following pantograph-type Volterra Hammerstein integral equation [27]

$$
\mathrm{z}(\mathrm{~s})=\mathrm{g}(\mathrm{~s})+\int_{0}^{\mathrm{qs}} \mathrm{R}(\mathrm{t}, \mathrm{~s}) \mathrm{G}(\mathrm{t}, \mathrm{z}(\mathrm{t})) \mathrm{dt}, \quad \mathrm{~s} \in[0,1]
$$

Where

$$
\left\{\begin{array}{l}
g(s)=\frac{1}{8}\left(4 \cosh \left(\frac{3 s}{4}\right)-4 \cosh (s)+s \sinh \left(\frac{3 s}{4}\right)\right)+\sinh ^{-1}\left(\frac{s}{2}\right) \\
\mathrm{q}=\frac{1}{4^{\prime}} \\
\mathrm{R}(\mathrm{~s}, \mathrm{t})=\cosh (\mathrm{s}-\mathrm{t}) \\
\mathrm{G}(\mathrm{t}, \mathrm{z}(\mathrm{t}))=\sinh (\mathrm{z}(\mathrm{t}))
\end{array}\right.
$$

And the exact solution is $z(s)=\sinh ^{-1}\left(\frac{s}{2}\right)$. The function $G(t, z(t))$ satisfies in the Lipschitz condition with respect to the second variable.

Table 3 contains a comparison of the $L^{2}$-norms of the error function between the presented method and the Legendre Tau method in [27] for Example 2. Figs. 5 and 6 show the plots of the obtained errors $\left|z-I_{N}^{C}(z)\right|$ by the presented method for Example 2 with $N=8$ and $N=32$, respectively. Fig. 11 shows tending $\left\|z-I_{N}^{C}(z)\right\|$ to zero by increasing $N$ in Example 2.

Example 3. Consider the following pantograph-type Volterra Hammerstein integral equation

$$
\mathrm{z}(\mathrm{~s})=\mathrm{g}(\mathrm{~s})+\int_{0}^{\mathrm{qs}} \mathrm{R}(\mathrm{t}, \mathrm{~s}) \mathrm{G}(\mathrm{t}, \mathrm{z}(\mathrm{t})) \mathrm{dt}, \quad \mathrm{~s} \in[0,1] .
$$

Where

$$
\left\{\begin{array}{l}
g(s)=2.125-0.42 s^{2}+\cos \left(\frac{s}{4}\right)-2 \cos \left(\frac{2 s}{5}\right)-0.125 \cos \left(\frac{4 s}{5}\right)-1.8 s \sin \left(\frac{2 s}{5}\right)- \\
0.225 s \sin \left(\frac{4 s}{5}\right), \\
q=\frac{8}{10}, \\
R(s, t)=s+t \\
G(t, z(t))=z(t)^{4} .
\end{array}\right.
$$

And the exact solution is $z(s)=\cos \left(\frac{s}{4}\right)$. The function $G(t, z(t))$ satisfies in the Lipschitz condition with respect to the second variable.

Table 4 contains the obtained errors $\left\|z-I_{N}^{C}(z)\right\|$ by the presented method for Example 3. Figs. 7 and 8 show the plots of the obtained errors $\left|z-I_{N}^{C}(z)\right|$ by the presented method in Example 3 for $N=8$ and $N=32$, respectively. Fig. 12 shows tending $\left\|z-I_{N}^{C}(z)\right\|$ to zero by increasing $N$ in Example 3 .

Fig. 11. Graph of tending $\left\|\mathrm{z}-\mathrm{I}_{\mathrm{N}}^{\mathrm{C}}(\mathrm{z})\right\|$ to zero by increasing $\mathbf{N}$ in example 2.

Fig. 12. Graph of tending $\left\|\mathrm{z}-\mathrm{I}_{\mathrm{N}}^{\mathrm{C}}(\mathrm{z})\right\|$ to zero by increasing $\mathbf{N}$ in example 3.

## 5 | Conclusion

In this work, we applied a spectral collocation method to the numerical solution of the pantograph-type Volterra Hammerstein integral equations based on the first kind Chebyshev polynomials. We employed

The convergence of the presented method is analyzed. Some numerical examples are prepared to test the accuracy of the proposed method. We observed that the proposed method is more accurate than Legendre Tau method in [27]. The other polynomials can be used for solving these equations such as Chelyshkov polynomials, Legendre polynomials, other kinds of Chebyshev polynomials, and so on.
